MAKE MY MARRIAGE

Product Requirements Document

All-in-one wedding management platform for Indian weddings

Project documentation | Version 1.0 | September 2026

Document Guide

This document is organized into the following sections:

1. Product Overview and Vision
2. Goals and Scope
3. Users and Permissions
4. Core Product Requirements
5. Guest and Collaboration Flows
6. Public Wedding Experience
7. MVP Phases
8. Success Metrics and Principles

1. Product Overview

Make My Marriage is an all-in-one wedding management platform designed for Indian weddings. One wedding workspace brings the couple, family members, and organizers together while guests interact through simple public or token-based experiences without creating accounts.

One account manages one wedding for the MVP. The bride or groom creates the wedding and becomes the initial Admin. Additional family members or organizers join the same wedding with their own Google accounts.

> **Core promise:** Replace fragmented planning across WhatsApp, spreadsheets, notes, expense trackers, vendor contacts, invitation tools, and photo-sharing services with one coordinated wedding workspace.

2. Product Vision

Make My Marriage should become the digital operating system for Indian weddings: practical enough for planning, simple enough for family collaboration, and beautiful enough for guest-facing experiences.

3. Product Goals

9. Centralize wedding planning information in one workspace.
10. Allow multiple family members to collaborate securely.
11. Organize the wedding around individual events such as Haldi, Mehndi, Sangeet, Wedding, and Reception.
12. Simplify guest assignment and event-level RSVP tracking.
13. Track tasks, expenses, shopping, vendors, and payments.
14. Provide digital invitations and a public wedding website.
15. Collect photos and videos from members and guests, including QR-based guest uploads.
16. Keep galleries private by default while allowing explicit share links.
17. Provide simple livestream access for selected events.
18. Demonstrate the full product through a public Ashu and Priya demo wedding.

4. MVP Non-Goals

- Vendor marketplace payments or bidding.
- Hotel and flight booking engines.
- Honeymoon booking.
- Full wedding-planner CRM.
- Native iOS and Android apps.
- AI planning assistant in the first MVP.
- In-house video streaming infrastructure.

5. User Types and Permissions

User Type	Authentication	Primary Capabilities
Admin	Google account	Full wedding control, members, events, guests, finances, vendors, website, media and sharing.
Member	Google account	Collaborate on planning, events, guests, tasks, expenses, vendors, shopping and media.
Guest	No account	RSVP, view shared wedding details, upload photos, view shared gallery and livestream.

Public Visitor	No account	View landing page and explore the read-only demo wedding.

6. Authentication and Wedding Creation

- **Authentication:** Google is the primary sign-in method for Admins and Members.
- **Guest access:** Guests never need a Make My Marriage account for RSVP, invitation, wedding website, QR upload, gallery share link, or livestream access.
- **Wedding setup:** A new authenticated user enters bride name, groom name, wedding date, city/location, and optional wedding details.
- **Automatic setup:** The backend creates the wedding workspace and pre-populates the standard Indian wedding events.

7. Wedding Dashboard

The dashboard is the central control center. It should summarize upcoming events, guests and RSVP status, tasks, expenses, shopping progress, vendors, recent media, and member activity.

- Quick actions: Add Guest, Create Event, Add Expense, Add Task, Add Vendor, Upload Photos.
- Dashboard data should be aggregated so the initial experience feels immediate and organized.

8. Event Management

- Default events: Haldi, Mehndi, Sangeet, Wedding, Reception.
- Admins may enable, edit, disable, or create custom events such as Roka, Engagement, Tilak, Cocktail, Vidaai, or After Party.
- Each event can carry date, time, venue, address, description, dress code, cover photo, guests, vendors, tasks, expenses, photos, notes, and livestream information.

9. Guest Management and RSVP

Guests live in one central wedding guest collection. A guest can be assigned to any number of events without duplicating the guest record.

- Guest fields: name, phone, email, side, family/group, city and notes.
- Side options: Bride, Groom, Common.
- RSVP statuses: Invited, Pending, Attending, Not Attending.
- RSVP is available through the wedding website, invitation, or dedicated RSVP link.
- The core guest model does not track a separate family-member attendance count.

10. Member Management

- Admins invite family members or organizers by email.
- Invited members authenticate with their own Google accounts.
- MVP roles: Admin and Member.
- Future permissions may include Guest Manager, Expense Manager, Event Manager, Photo Manager, or Wedding Planner.

11. Tasks, Expenses, and Shopping

11.1 Tasks

- Wedding-level or event-level tasks.
- Fields include title, description, assignee, due date, priority, status and notes.
- Statuses: To Do, In Progress, Completed.

11.2 Expenses

- Track title, category, event, vendor, amount, paid amount, payment status, payment date, notes and receipt.
- Show total, paid, remaining, by event and by category.
- No estimated wedding budget is required for the core MVP.

11.3 Shopping

- Track wedding shopping independently of expenses.
- Fields include item, category, for whom, event, assignee, store/vendor, cost, status and notes.
- Statuses: Need to Buy, Shortlisted, Ordered, Purchased.

12. Vendors

- Support categories including photographers, videographers, caterers, decorators, tent houses, makeup artists, mehndi artists, DJs, bands, florists, hotels, venues, transport, pandits and choreographers.
- Users can save a discovered or manually entered vendor to their wedding.
- A saved wedding vendor can be linked to one or multiple events.
- Vendor marketplace transactions are outside the first MVP.

13. Digital Invitation and Wedding Website

- Every wedding gets a digital invitation with couple names, date, events, venue, timing, photos, message, RSVP and wedding website link.
- Every wedding gets a public-facing website using a unique slug.
- Initial website theme: Classic.
- Admin controls which wedding website sections are public.
- Guest-facing content must be separated from private planning data.

14. Photos, QR Uploads, and Gallery Privacy

- Members upload photos and videos to a central media library and event albums.
- Guests can upload without an account through a secure upload page.
- QR codes can open the guest upload flow directly at the venue.
- Galleries remain private by default.
- Admins or authorized members can generate non-guessable share links.
- Future enhancements may add password protection, expiry, watermarks and download controls.

15. Livestream

Admins can attach an external livestream link to an event. The MVP embeds or links to existing livestream providers instead of operating custom streaming infrastructure.

16. Public Landing Page and Demo

- Landing page communicates the platform value, key features, how it works, product previews and primary create-wedding CTA.
- The public demo wedding is named Ashu and Priya for the current product design.
- Demo visitors can explore realistic events, guests, RSVP, expenses, tasks, vendors, invitations, media and livestream examples.
- Anonymous demo users must not permanently modify canonical demo data.

17. Information Architecture

```
Dashboard
Events
Guests
Tasks
Expenses
Shopping
Vendors
Invitations
Photos
Livestream
Wedding Website
Members
Settings
```

Event detail pages should provide contextual access to Overview, Guests, Tasks, Vendors, Expenses, Photos and Livestream.

18. Privacy and Security Requirements

- Planning data requires authentication.
- Members can only access weddings they belong to.
- Guest/public routes must never grant dashboard access.
- Share and upload tokens must be high entropy and non-predictable.
- File uploads require type and size validation plus abuse controls.
- Authorization must be enforced server-side.
- Public APIs return only explicitly public fields.

19. MVP Delivery Phases

Phase	Scope
1 - Core Planning	Google login, wedding creation, dashboard, events, members, guests, event assignments, RSVP, tasks, expenses, shopping.
2 - Vendors and Sharing	Vendor management/discovery, invitations, public wedding website and public RSVP.
3 - Media	Member uploads, event albums, guest/QR uploads, private galleries, share links and livestream links.
4 - Public Product Experience	Landing page, Ashu and Priya demo, onboarding polish and website customization.

20. Success Metrics

- Activation: registered users who create a wedding.

- Setup depth: weddings with at least three configured events.
- Collaboration: average members per wedding.
- Guest usage: guests added and RSVP completion rate.
- Planning engagement: tasks, expenses, shopping items and vendors created.
- Media engagement: photos uploaded, especially guest contributions.
- Sharing: website visits, invitation opens, gallery sessions and QR upload sessions.
- Demo conversion: visitors who explore the demo and then create a wedding.

21. Product Principle

> **MVP principle:** Simple setup -> centralized information -> family collaboration -> event-based organization -> effortless guest sharing.

The product should feel significantly simpler than coordinating a wedding across WhatsApp, spreadsheets, Google Drive, notes, expense apps, vendor contacts and separate galleries.
